Telecharger la Formation sur Elephorme Matlab is the R2016a implementation of the MATLAB language with introduced functions and classes. Matlab is a first-order imperative language with a dynamic type system. Matlab uses a significant extension of the standard syntax for specifying types including explicit type declarations, type coercions, and a distinction between variables and anonymous arrays. Matlab supports dynamic typing, in the sense that the types of the variables are checked only when they are actually used. Matlab supports automatic type inference, which is similar to type-checking, however, in Matlab this type-checking is done at compile-time. In Matlab there are three kinds of variables: 1) User-defined variables, which are dynamically typed and are subject to run-time type checking; 2) System variables, which are statically typed and have a compile-time type; and 3) Anonymous variables, which are also statically typed but the type is not checked at run-time. Matlab uses two different kinds of types: Scalar (or elemental) types, such as double or int8 are implicit in all expressions. Matrix and string types can be explicitly defined using the function definitions (see Reference); these are used to define a general type, independent of the datatype of the actual values that are contained in the type. Matlab supports Matrices, Lists, Arrays, Strings, Uniforms and Discrete distributions. Matlab provides an interactive graphical user interface which allows the user to input a command, edit the command, execute the command, or preview the results. This interface is called a Command Window. Matlab supports interactive model-driven programming using dynamic link libraries (DLL).
